While gasoline and kerosene have been the main fuels for aircraft for decades, contemporary concepts favour hybrid and all-electric power units.

The agility of a tank is its ability to speed up, turn, jink, and stop. To move heavier MBTs, powerful engines that generate tremendous horsepower are required.

Concerned about your IMU's performance after 30 years of storage or use?

Don't worry — we have taken care of it!

Gyro modules and Inertial Measurement Units

ITAR free, Laser-welded 6082-T6 nonmagnetic alloy housing, SurTec 650 surface treated, backward compatibility, 50 grams weight, 100% helium leak tested, guaranteed availability 10+ years

Predicting the future can be difficult. But providing predictability in inertial measurement units is our specialty. The STIM377H and STIM277H are hermetically sealed IMUs and gyro modules designed for applications that require the highest long-term reliability.

In our testing, we have simulated 30 years of operation or storage at high and low temperatures to give you the best insight into predicting their performance.

A 3,000-hour qualification program of HTOL, HTSL, LTOL and LTSL, including read-out at every 1,000 hours has confirmed performance at the end of the program.

By implementing the STIM377H or STIM277H, you reduce uncertainty in your design, whether it is planned for three decades of immediate use or long-term storage towards future use.

When size, performance and robustness matter
